Question Label : Multiple Select Question

Consider a neuron with binary inputs  $x_1$  and  $x_2$ , and an output  $y$ . The neuron computes the weighted sum of its inputs and produces an output according to a threshold. The threshold is denoted as  $\theta$ . The activation function is such that  $y = 1$  if the weighted sum is greater than or equal to  $\theta$ , otherwise  $y = 0$ .

Which of the following statements are correct regarding the neuron's ability to represent logical AND and OR functions?

Options :

0/3

6406532475514. The neuron can implement the AND function by setting appropriate weights and a threshold.
6406532475515. The neuron can implement the OR function by setting appropriate weights and a threshold.
6406532475516. There exists a single set of weights and a threshold that allows the same neuron to correctly implement both the AND and OR functions simultaneously.
6406532475517. Neurons are limited to implementing either the AND or the OR function and cannot represent both simultaneously.

Question Label : Short Answer Question

Suppose we have a perceptron with two inputs,  $x_1$  and  $x_2$ . This perceptron undergoes training on a small dataset containing three points:  $(-1, 2)$  labeled as class 0,  $(0, -1)$  labeled as class 1, and  $(2, 1)$  labeled as class 0. The weights of the perceptron are initialized to zeros, and the model is trained until it reaches convergence. Given this scenario, what would be the assigned output class by the trained perceptron for the new point  $(-2, 0)$ ?

The logistic sigmoid neuron  $\sigma(x)$  is defined as follows

$$\sigma(x) = \frac{1}{1 + \exp(-(wx + b))}$$

where  $w, b \in \mathbb{R}$  are learnable parameters. Take Mean Square Error loss where required

$$L = 0.5 * (\hat{y} - y)^2$$

Suppose we use the sigmoid function to fit the pair  $x = 0, y = 1$ , where  $x$  is an input and  $y$  is the ground truth. Suppose that  $w$  is initialized to  $w = 2$  and  $b$  is initialized to  $b = 1$ . The prediction  $\hat{y}$  by the model for the current  $w, b$  is,  $\hat{y} = 0.731$ . Update the parameter once by keeping  $\eta = 10$  and compute the loss. Enter the new loss value.

Note: Enter the loss value to three significant digits. That is, if your answer is 0.06134, then enter it as 0.061

$$\begin{aligned} x &= 0 & y &= 1 \\ w &= 2 & b &= 1 \\ \hat{y} &= 0.731 \\ \eta &= 10 \end{aligned}$$

$$w_{t+1} = w_t - \eta \nabla w$$

$$b_{t+1} = b_t - \eta \nabla b$$

Response Type : Numeric

Possible Answers :

$$\Rightarrow \frac{\partial L}{\partial w} = \frac{\partial L}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial a} \cdot \frac{\partial a}{\partial w}$$

$$\begin{aligned} \textcircled{1} L &= \frac{1}{2} (\hat{y} - y)^2 \Rightarrow \frac{\partial L}{\partial \hat{y}} = \hat{y} - y = -0.269 \\ \textcircled{2} \hat{y} &= h = \sigma(a) \Rightarrow \frac{\partial \hat{y}}{\partial a} = h(1-h) = 0.731 \times 0.269 = 0.1966 \end{aligned}$$

Question Number : 48 Question Id : 640653740174 Question Type : SA Calculator : None

Response Time : N.A Think Time : N.A Minimum Instruction Time : 0

Correct Marks : 4

Question Label : Short Answer Question

Consider a quadratic loss function given by  $L(w) = (w - 4)^2$ , where  $w$  represents the model parameter. You are using momentum-based gradient descent to minimize this loss. The momentum parameter is set to 0.9, the learning rate is 0.1, and the initial parameter value is  $w = 0$ . What is the updated weight value after one iteration?

$$\begin{aligned} \textcircled{3} a &= wx + b \Rightarrow \frac{\partial a}{\partial w} = x = 0 \\ \Rightarrow \frac{\partial L}{\partial w} &= 0 \end{aligned}$$

Response Type : Numeric

Evaluation Required For SA : Yes

Show Word Count : Yes

Answers Type : Range

Text Areas : PlainText

Possible Answers :

$$\begin{aligned} \frac{\partial L}{\partial b} &= \frac{\partial L}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial a} \cdot \frac{\partial a}{\partial b} \\ \textcircled{4} a &= wx + b \Rightarrow \frac{\partial a}{\partial b} = 1 \end{aligned}$$

$$\Rightarrow \frac{\partial L}{\partial b} = -0.269 \times 0.1966 \times 1 = -0.053$$

$$\therefore w_{t+1} = 2 - 10(0) \Rightarrow w_{t+1} = 2$$

$$b_{t+1} = 1 - 10(-0.053) \Rightarrow b_{t+1} = 1.53$$

$$a_{t+1} = w x + b = b = 1.53$$

$$h_{t+1} = \hat{y}_{t+1} = \sigma(a_{t+1}) = \sigma(1.53) = 0.822$$

$$\begin{aligned} L_{t+1} &= 0.5 (\hat{y}_{t+1} - y)^2 = 0.5 (0.822 - 1)^2 \\ &= 0.5 (-0.178)^2 = 0.0158 \end{aligned}$$

Question Label : Multiple Choice Question

Consider a sigmoid function

$$f(x) = \frac{1}{1 + e^{-(wx+b)}}$$

Suppose that  $w$  is restricted to take only positive values ( $w > 0$ ). Suppose further that we define the steepness of the curve as absolute value of the slope. Then, select all the correct statements about the function

⇒ ALWAYS CONVERT TO STD FORM

$$\frac{1}{1 + e^{-(wx+b)}} \neq \frac{1}{1 + e^{-wx+b}}$$

⇒ If  $b$  increases, curve moves LEFT

⇒ If  $w$  increases, curve becomes STEEPER

6406532475525. Increasing the value of  $b$  shifts the sigmoid function to the left (i.e., towards negative infinity)

6406532475526. Increasing the value of  $b$  shifts the sigmoid function to the right (i.e., towards positive infinity)

6406532475527. Decreasing the value of  $w$  increases the steepness of the sigmoid function

6406532475528. Increasing the value of  $w$  decreases the steepness of the sigmoid function

$$h_3 = \begin{bmatrix} a & b & c \end{bmatrix} \quad \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

$$w_3 = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} \quad \hat{y} = \begin{bmatrix} 0.2 \\ 0.2 \\ 0.2 \\ 0.2 \\ 0.2 \end{bmatrix}$$

$$-\ln(0.2) = 1.609$$

Consider a neural network with two hidden layers and one output layer, as shown below. Here,  $a_k$  is a pre-activation and  $h_k$  is the output from the  $k$ -th layer. All the neurons in the hidden layers use a sigmoid activation function. Suppose that the neural network is used for a classification problem with 3 classes (such that any given input belongs to exactly one class). Suppose further that the number of neurons in each hidden layer is 3 and we have only three neurons in the output layer. Suppose that the weights are initialized as follows

$$W_1 = W_2 = W_3 = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

The true label for the input  $h_0 = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$  is one hot encoded as  $y = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ .

Assume that the output layer uses softmax activation and the neurons in the network has no bias associated with it.

Based on the above data, answer the given subquestions.
