

# Programming Concepts Using Java

## Revision Slides

# W01:L01: Introduction

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Explore concepts in programming languages
  - Object-oriented programming
  - Exception handling, concurrency, event-driven programming, ...
- Use Java as the illustrative language
  - Imperative, object-oriented
  - Incorporates almost all features of interest
- Discuss design decisions where relevant
  - Every language makes some compromises
- Understand and appreciate why there is a zoo of programming languages out there
- ...and why new ones are still being created

# W01:L02: Types

Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Types have many uses
  - Making sense of arbitrary bit sequences in memory
  - Organizing concepts in our code in a meaningful way
  - Helping compilers catch bugs early, optimize compiled code
- Some languages also support automatic type inference
  - Deduce the types of a variable statically, based on the context in which they are used
  - `x = 7` followed by `y = x + 15` implies `y` must be `int`
  - If the inferred type is consistent across the program, all is well

# W01:L03: Memory Management

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Variables have **scope** and **lifetime**
  - Scope — whether the variable is available in the program
  - Lifetime — whether the storage is still allocated
- Activation records for functions are maintained as a stack
  - Control link points to previous activation record
  - Return value link tells where to store result
- Two ways to initialize parameters
  - Call by value
  - Call by reference
- Heap is used to store dynamically allocated data
  - Outlives activation record of function that created the storage
  - Need to be careful about deallocating heap storage
  - Explicit deallocation vs automatic garbage collection

# W01:L04: Abstraction and Modularity

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Solving a complex task requires breaking it down into manageable components
  - Top down: refine the task into subtasks
  - Bottom up: combine simple building blocks
- Modular description of components
  - Interface and specification
  - Build prototype implementation to validate design
  - Reimplement the components independently, preserving interface and specification
- PL support for abstraction
  - Control flow: functions and procedures
  - Data: Abstract data types, object-oriented programming

# W01:L05: OOPS

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Objects are like abstract datatypes
- Uniform way of encapsulating different combinations of data and functionality
- Distinguishing features of object-oriented programming
  - Abstraction
    - Public interface, private implementation, like ADTs
  - Subtyping
    - Hierarchy of types, compatibility of interfaces
  - Dynamic lookup
    - Choice of method implementation is determined at run-time
  - Inheritance
    - Reuse of implementations

# W01:L06: Classes

## Revision Slides

### Week 1

### Week 2

### Week 3

### Week 4

### Week 5

### Week 6

### Week 7

### Week 8

### Week 9

### Week 10

### Week 11

### Week 12

- A class is a template describing the instance variables and methods for an abstract datatype
- An object is a concrete instance of a class
- We should separate the public interface from the private implementation
- Hierarchy of classes to implement subtyping and inheritance
- A language like Python has no mechanism to enforce privacy etc
  - Can illegally manipulate private instance variables
  - Can introduce inconsistencies between subtype and parent type
- Use strong declarations to enforce privacy, types
  - Do not rely on programmer discipline
  - Catch bugs early through type checking

# Getting started with Java

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Java program to print **hello, world**

```
public class HelloWorld{  
    public static void main(String[] args) {  
        System.out.println("hello, world");  
    }  
}
```

- A Java program is a collection of classes
- All code in Java lives within a class
- Modifier **public** specifies visibility
- The signature of **main( )**
  - Input parameter is an array of strings; command line arguments
  - No output, so return type is **void**
- **Write once, run anywhere**

# Scalar types

Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Java has eight primitive scalar types

- int, long, short, byte
- float, double
- char
- boolean

- We declare variables before we use them

```
int x, y;  
x = 5;  
y = 10;
```

- Characters are written with single-quotes (only)

```
char c = 'x';
```

- Boolean constants are **true**, **false**

```
boolean b1, b2;  
b1 = false;  
b2 = true;
```

# Scalar types

## Revision Slides

- Initialize at time of declaration

```
float pi = 3.1415927f;
```

- Modifier `final` indicates a constant

```
final float pi = 3.1415927f;
```

Week 1

Week 12

# Operators

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Arithmetic operators are the usual ones

`+, -, *, /, %`

- No separate integer division operator `//`
- When both arguments are integer, `/` is integer division
- No exponentiation operator, use `Math.pow()`
- `Math.pow(a,n)` returns  $a^n$
- Special operators for incrementing and decrementing integers

```
int a = 0, b = 10;  
a++; // Same as a = a+1  
b--; // Same as b = b-1
```

- Shortcut for updating a variable

```
int a = 0, b = 10;  
a += 7; // Same as a = a+7
```

# Strings

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- String is a built-in class
- String constants enclosed in double quotes

```
String s = "Hello", t = "world";
```

- `+` is overloaded for string concatenation

```
String s = "Hello";  
String t = "world";  
String u = s + " " + t;  
// "Hello world"
```

- Strings are **not arrays of characters**
- Instead use `s.charAt(0)`, `s.substring(0,3)`

# Arrays

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Arrays are also objects
- Typical declaration

```
int[] a;  
a = new int[100];
```
- Or `int a[]` instead of `int[] a`
- `a.length` gives size of `a`
- Array indices run from `0` to `a.length-1`

# Control flow

## Revision Slides

- Conditional execution

```
if (condition) { ... } else { ... }
```

- Conditional loops

```
while (condition) { ... }  
do { ... } while (condition)
```

- Iteration - Two kinds of `for`
- Multiway branching – `switch`

Week 1

# Classes and objects

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- A class is a template for an encapsulated type
- An object is an instance of a class

```
public class Date {  
    private int day, month, year;  
    public Date(int d, int m, int y){  
        day = d;  
        month = m;  
        year = y;  
    }  
    public int getDay(){  
        return(day);  
    }  
}
```

- **Instance variables** - Each concrete object of type **Date** will have local copies of date, month, year

# Creating and initializing objects

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **new** creates a new object
- How do we set the instance variables?
- **Constructors** — special functions called when an object is created
  - Function with the same name as the class
  - `d = new Date(13,8,2015);`
- **Constructor overloading** - same name, different signatures
- A constructor can call another one using **this**
- If no constructor is defined, Java provides a default constructor with empty arguments
  - `new Date()` would implicitly invoke **this**
  - Sets instance variables to sensible defaults
  - For instance, int variables set to 0
  - Only valid if no constructor is defined
  - Otherwise need an explicit constructor without arguments

# Copy constructors

Revision Slides

- Create a new object from an existing one

```
public class Date {
    private int day, month, year;
    public Date(int d, int m, int y){
        day = d; month = m; year = y;
    }
    public Date(Date d){
        this.day = d.day; this.month = d.month; this.year = d.year;
    }
}

public class UseDate() {
    public static void main(String[] args){
        Date d1,d2;
        d1 = new Date(12,4,1954); d2 = new Date(d1);
    }
}
```

# Basic input and output in java

## Revision Slides

- Reading input

- Use `Console` class
- Use `Scanner` class

```
Scanner in = new Scanner(System.in);  
String name = in.nextLine();  
int age = in.nextInt();
```

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **Structured programming**
  - The algorithms come first
    - Design a set of procedures for specific tasks
    - Combine them to build complex systems
  - Data representation comes later
    - Design data structures to suit procedural manipulations
- **Object Oriented design**
  - First identify the data we want to maintain and manipulate
  - Then identify algorithms to operate on the data
- **Designing objects**
  - **Behaviour** – what methods do we need to operate on objects?
  - **State** – how does the object react when methods are invoked?
    - **State** is the information in the instance variables
    - **Encapsulation** – should not change unless a method operates on it

# W03:L01: The philosophy of OO programming (Cont.)

## Revision Slides

- Relationship between classes

- Dependence

- Order needs Account to check credit status
    - Item does not depend on Account
    - Robust design minimizes dependencies, or coupling between classes

- Aggregation

- Order contains Item objects

- Inheritance

- One object is a specialized versions of another
    - ExpressOrder inherits from Order
    - Extra methods to compute shipping charges, priority handling

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- A subclass extends a parent class
- Subclass inherits instance variables and methods from the parent class
- Subclass can add more instance variables and methods
  - Can also **override** methods
- Subclasses cannot see private components of parent class
- Use **super** to access constructor of parent class
- **Manager** objects inherit other fields and methods from **Employee**
- Every **Manager** has a **name**, **salary** and methods to access and manipulate these.

```
public class Employee{
    private String name;
    private double salary;

    // Some Constructors ...

    // "mutator" methods
    public boolean setName(String s){ ... }
    public boolean setSalary(double x){ ... }

    // "accessor" methods
    public String getName(){ ... }
    public double getSalary(){ ... }

    // other methods
    public double bonus(float percent){
        return (percent/100.0)*salary;
    }
}

public class Manager extends Employee{
    private String secretary;
    public boolean setSecretary(name s){ ... }
    public String getSecretary(){ ... }
}
```

# W03:L03: Dynamic dispatch and polymorphism

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **Manager** can redefine **bonus()**

```
double bonus(float percent){  
    return 1.5*super.bonus(percent);  
}
```

  - Uses parent class **bonus()** via **super**
  - **Overrides** definition in parent class
- Consider the following assignment

```
Employee e = new Manager(...)
```
- Can we invoke **e.setSecretary()**?
  - **e** is declared to be an **Employee**
  - Static typechecking – **e** can only refer to methods in **Employee**

```
public class Employee{  
    private String name;  
    private double salary;  
  
    // Some Constructors ...  
  
    // "mutator" methods  
    public boolean setName(String s){ ... }  
    public boolean setSalary(double x){ ... }  
  
    // "accessor" methods  
    public String getName(){ ... }  
    public double getSalary(){ ... }  
  
    // other methods  
    public double bonus(float percent){  
        return (percent/100.0)*salary;  
    }  
}  
  
public class Manager extends Employee{  
    private String secretary;  
    public boolean setSecretary(name s){ ... }  
    public String getSecretary(){ ... }  
}
```

# W03:L03: Dynamic dispatch and polymorphism (Cont.)

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- What about `e.bonus(p)`? Which `bonus()` do we use?

- **Static:** Use `Employee.bonus()`
- **Dynamic:** Use `Manager.bonus()`

- **Dynamic dispatch** (dynamic binding, late method binding, . . . ) turns out to be more useful

- **Polymorphism**

- Every Employee in `emparray` "knows" how to calculate its bonus correctly!

```
Employee[] emparray = new Employee[2];
Employee e = new Employee(...);
Manager m = new Manager(...);
emparray[0] = e;
emparray[1] = m;
for (i = 0; i < emparray.length; i++){
    System.out.println(emparray[i].bonus(5.0));
}
```

```
public class Employee{
    private String name;
    private double salary;

    // Some Constructors ...

    // "mutator" methods
    public boolean setName(String s){ ... }
    public boolean setSalary(double x){ ... }

    // "accessor" methods
    public String getName(){ ... }
    public double getSalary(){ ... }

    // other methods
    public double bonus(float percent){
        return (percent/100.0)*salary;
    }
}

public class Manager extends Employee{
    private String secretary;
    public boolean setSecretary(name s){ ... }
    public String getSecretary(){ ... }
}
```

# W03:L03: Dynamic dispatch and polymorphism (Cont.)

## Revision Slides

- Signature of a function is its name and the list of argument types
- **Overloading**: multiple methods, different signatures, choice is static
- **Overriding**: multiple methods, same signature, choice is static
  - `Employee.bonus()`
  - `Manager.bonus()`
- **Dynamic dispatch**: multiple methods, same signature, choice made at run-time

```
double[] darr = new double[100];
int[] iarr = new int[500];
...
Arrays.sort(darr);
    // sorts contents of darr
Arrays.sort(iarr);
    // sorts contents of iarr
class Arrays{
    ...
    public static void sort(double[] a){..}
        // sorts arrays of double[]
    public static void sort(int[] a){..}
        // sorts arrays of int[]
    ...
}
```

Week 11

Week 12

# W03:L03: Dynamic dispatch and polymorphism (Cont.)

## Revision Slides

### Type casting

- Consider the following assignment  
`Employee e = new Manager(...)`
- `e.setSecretary()` does not work
  - Static type-checking disallows this
- Type casting — convert `e` to `Manager`  
`((Manager) e).setSecretary(s)`
- Cast fails (error at run time) if `e` is not a `Manager`
- Can test if `e` is a `Manager`

```
if (e instanceof Manager){  
    ((Manager) e).setSecretary(s);  
}
```

```
public class Employee{  
    private String name;  
    private double salary;  
  
    // Some Constructors ...  
  
    // "mutator" methods  
    public boolean setName(String s){ ... }  
    public boolean setSalary(double x){ ... }  
  
    // "accessor" methods  
    public String getName(){ ... }  
    public double getSalary(){ ... }  
  
    // other methods  
    public double bonus(float percent){  
        return (percent/100.0)*salary;  
    }  
}  
  
public class Manager extends Employee{  
    private String secretary;  
    public boolean setSecretary(name s){ ... }  
    public String getSecretary(){ ... }  
}
```

# W03:L04: The Java class hierarchy

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Java does not allow multiple inheritance
  - A subclass can extend only one parent class
- The Java class hierarchy forms a tree
- The root of the hierarchy is a built-in class called `Object`
  - `Object` defines default functions like `equals()` and `toString()`
  - These are implicitly inherited by any class that we write
- When we override functions, we should be careful to check the signature
- Useful methods defined in `Object`

```
public boolean equals(Object o) // defaults to pointer equality
public String toString()       // converts the values of the
                               // instance variables to String
```
- For Java objects `x` and `y`, `x == y` invokes `x.equals(y)`
- To print `o`, use `System.out.println(o+"");`
  - Implicitly invokes `o.toString()`

# W03:L05: Subtyping vs inheritance

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Class hierarchy provides both **subtyping** and **inheritance**
- **Subtyping**
  - Capabilities of the subtype are a superset of the main type
  - If **B** is a subtype of **A**, wherever we require an object of type **A**, we can use an object of type **B**
  - **Employee e = new Manager(...);** is legal
  - **Compatibility of interfaces**
- **Inheritance**
  - Subtype can reuse code of the main type
  - **B** inherits from **A** if some functions for **B** are written in terms of functions of **A**
  - **Manager.bonus()** uses **Employee.bonus()**
  - **Reuse of implementations**
- Using one idea (hierarchy of classes) to implement both concepts blurs the distinction between the two

# W03:L06: Java modifiers

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **private** and **public** are natural artefacts of encapsulation
  - Usually, instance variables are **private** and methods are **public**
  - However, **private** methods also make sense
- Modifiers **static** and **final** are orthogonal to **public/private**
- Use **private static** instance variables to maintain bookkeeping information across objects in a class
  - Global serial number, count number of objects created, profile method invocations, . . .
- Usually **final** is used with instance variables to denote constants
- A **final** method cannot be overridden by a subclass
- A **final** class cannot be inherited
- Can also have **private** classes

# Abstract classes

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Sometimes we collect together classes under a common heading
- Classes Swiggy, Zomato and UberEat are all food order
- Create a class FoodOrder so that Swiggy, Zomato and UberEat extend FoodOrder
- We want to force every FoodOrder class to define a function  
`public void order() {}`
- Now we should force every class to define the `public void order();`
- Provide an abstract definition in FoodOrder  
`public abstract void order();`

# Interfaces

## Revision Slides

- An interface is a purely abstract class
- All methods are abstract by default
- All data members are final by default
- If any class implement an interface, it should provide concrete code for each abstract method
- Classes can implement multiple interfaces
- Java interfaces extended to allow static and default methods from JDK 1.8 onwards
- If two interfaces has same default/static methods then its implemented class must provide a fresh implementation
- If any class wants to extend another class and an interface then it should inherit the class and implements interface

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

# private classes

## Revision Slides

- An instance variable can be a user defined type

```
public class BookMyshow{  
    String user;  
    int tickets;  
    Payment payement;  
}  
  
public class Payment{  
    int cardno;  
    int cvv;  
}
```

- Payment is a public class, also available to other classes
- Payment class has sensitive information, so there is a security concern.

# private classes

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- We cannot declare Payment class as private outside the BookMyshow class
- You can declare Payment class as private inside the BookMyshow class

```
public class BookMyshow{  
    String user;  
    int tickets;  
    Payment payment;  
    private class Payment{  
        int cardno;  
        int cvv;  
    }  
}
```

- Now Payment class is a private member of the BookMyshow class
- Now Payment class only available to the BookMyshow class

# Interaction with State(Manipulating objects)

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Consider the class student below.
- Student class is encapsulated by private variables.

```
public class Student{  
    private String rollno;  
    private String name;  
    private int age;  
    //3 mutator methods  
    //3 Accessor methods  
}
```

- Consider Student class has student1,student2.....student60 objects
- Update date as a whole, rather than individual components

# Interaction with State(Manipulating objects)

## Revision Slides

```
public class Student{  
    private String rollno;  
    private String name;  
    private int age;  
    public void setStudent(String rollno,String name,int age){  
        }  
}
```

- Now public void setStudent(String rollno, String name, int age) update the Student object as a whole.

# Java Call back methods.

## Revision Slides

- what is call back method?

```
interface Notification{
    void notification();//should be overridden in WorkingDay and Weekend
}
class WorkingDay implements Notification{
}
class Weekend implements Notification{
}
class Timer{//Timer will decide which call back function should be call
}
public class User {
    public static void main(String[] args) {
        Timer timer=new Timer();
        timer.start(new Date());
    }
}
```

# Iterators

## Revision Slides

- what is Iterator?
- You can loop through any data structure using an Iterator.

```
public interface Iterator{  
    public abstract boolean has_next();  
    public abstract Object get_next();  
}
```

Week 1

# W5:L1: Polymorphism Revisited

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- In object-oriented programming, polymorphism usually refers to the effect of **dynamic dispatch**
- Depending upon the object type stored in a reference variable appropriate version of overridden and non-overridden methods are invoked automatically.

- **Structural Polymorphism**

- ```
public int find(Superclass[] arr, subclass o){  
    int i;  
    for(i =0 ;i < arr.length; i++){  
        if(arr[i].equals(o)) return i;  
    }  
    return -1;  
}
```

- *Can also be obtained by using interfaces, this is what we have been doing with **Comparable<T>** interface*

- We are actually **grouping types with one common behaviour** under a parent type (class/interface) which can then polymorphically refer to appropriate subtypes depending upon actual instance type.

# W5:L1: Polymorphism Revisited (Cont.)

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **Type Consistency:**

Source type can be either same as target type or a subtype of target type. In other words a super type reference variable/array can store subtype objects but not vice versa.

- **Inference:**

Inheritance/polymorphism cannot guarantee a complete **type generalization** of our program.

- **Using *Object* to generalize types in a program**

Problems:

- Type information is lost needs explicit casting on every use.
- Homogeneity cannot be guaranteed.

- **Solution: Generics**

- Classes and functions can have type parameters

1. `class MyDataStructure<T>` holds values of type `T`

2. `public T getMatch(T obj)` accepts and returns values of same type `T` as enclosing enclosing class

- Can also use constraints by mixing inheritance rules.

```
public static <S extends T,T> void getMatch(S[] sarr, T obj){...}
```

# W5:L2: Generics

## Revision Slides

- Example of a polymorphic List

```
public class LinkedList<T>{  
    private int size;  
    private Node first;  
    public T head(){  
        T returnval;  
        ...  
        return(returnval);  
    }  
    public void insert(T newdata){...}  
    private class Node {  
        private T data;  
        private Node next;  
        ...  
    }  
}
```

# W5:L2: Generics (Cont.)

## Revision Slides

- Be careful not to accidentally hide a type variable

```
class MyClass<S>{  
    public <S,T> void myMethod(S obj){  
        T obj2;  
        ...  
    }  
}
```

Quantifier  $\langle S, T \rangle$  of myMethod masks the type parameter S of class MyClass.

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- **Covariance of types:**

If S is a subtype of T and a reference of T can store an object of S, then T[] can also refer S[].

*Arrays are covariant:*

```
Integer[] arr1 = {10,20,30};  
Number[] arr2 = arr1;  
System.out.println(arr2[2]); // 30
```

- Now, try running this:

```
arr2[1] = 9.8; // It's not allowed, generates exception.
```

*The detailed type checking is only done **only at runtime**, compiler will check for supertype-subtype relation and if that conforms, it will allow the code.*

*Why the statement is executing at runtime?*

- **Issue with generics:**

JVM erases the type information related to a generic type after the compilation is done, i.e. at runtime unlike non-generic type variables/references, generic variables will not have any type characteristics. This process is called **type erasure**.

Which means all type checking must be done by compiler, but as compiler cannot check object's type during compile time, so JAVA prohibits the covariance property for generic types.

- **List<Subtype>** is not compatible with **List<Supertype>**

```
List<String> s = {"A","B"};  
List<Object> o = s; // Illegal use
```

# W5:L3: Wildcard

*Reflective programming* or *reflection* is the ability of a process to examine, introspect, and modify its own structure and behaviour. (Source: Wikipedia)

- Introspect: A program can observe, and therefore reason about its own state.
- Intercede: A program can modify its execution state or alter its own interpretation or meaning.

# Reflection in Java

## Revision Slides

```
Employee e = new Manager(...);  
...  
if (e instanceof Manager){  
    ...  
}
```

- What if we don't know the type that we want to check in advance?
- Suppose we want to write a function to check if two different objects are both instances of the same class?

# Reflection in Java ...

## Revision Slides

```
public static boolean classequal(Object o1, Object o2){  
    ...  
    // return true iff o1 and o2 point to objects of same type  
    ...  
}
```

- We cannot use `instanceof` because we will have to check across all defined classes, which is not a fixed set.
- We cannot use generic type variables because if (o1 instance of T) is not permitted.

# Introspection in Java

Week 10

Week 11

Week 12

- Extracting information about constructors, methods and fields

```
Class c = obj.getClass();
Constructor[] constructors = c.getConstructors();
Method[] methods = c.getMethods();
Field[] fields = c.getFields();
```

- `Constructor`, `Method`, `Field` in turn have functions to get further details
- Example: Get the list of parameters for each constructor

```
Class c = obj.getClass();
Constructor[] constructors = c.getConstructors();
for (int i = 0; i < constructors.length; i++){
    Class params[] = constructors[i].getParameterTypes();

}
```

# Reflection and security

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Java does not keep type information of generics at runtime, all type compatibilities are checked during compile time.

```
if(s instanceof ArrayList<String>) // Compilation error
```

- At run time, all type variables are promoted to Object

```
ArrayList<T> becomes ArrayList<Object>
```

- Or the upper bound, if available

```
ArrayList<T extends Mammals> becomes ArrayList<Mammals>
```

- Type erasure leads to illegal overloading which were legal on non generics.

```
public void myMethod(ArrayList<Integer> i)...
```

```
public void myMethod(ArrayList<Mammal> m)...
```

- To avoid runtime errors generic type arrays can be declared but can't be instantiated.

```
T[] arr;
```

```
arr = new T[20]; // Compiler error
```

# W06:L01: Indirection

## Revision Slides

- Suppose two separate implementation

```
public class CircularArrayQueue<E> {  
    public void add (E element){...};  
    public E remove(){...};  
    public int size(){...};  
    ...  
}
```

```
public class LinkedListQueue<E> {  
    public void add (E element){...};  
    public E remove(){...};  
    public int size(){...};  
    ...  
}
```

# W06:L02: Java-Collections

## Revision Slides

### ● Collections Framework?

- collection of interfaces and classes.
- organizing a group of heterogeneous objects efficiently.
- Framework has several useful classes which have tons of useful methods which makes a programmer task super easy.
- Some collections allow duplicate elements, while others do not.
- Some collections are ordered and others are not.
- Reduced development effort by using core collection classes rather than implementing our own collection classes.

<https://www.sneppets.com/java/collections-framework/collection-and-collections-framework-in-java/>

# W06:L03: Java-Concrete-Collections

## Revision Slides

- The List interface
  - An ordered collection can be accessed in two ways
  - Through an iterator
  - By position
- ```
public interface List<E>  
    extends Collection<E>{  
        void add(int index, E element);  
        void remove(int index);  
        E get(int index);  
        E set(int index, E element);  
    }
```
- List interface implemented classes.
  - ArrayList
  - LinkedList
  - Vector
  - Stack

# W07:L01: Dealing with errors

## Revision Slides

- Our code could encounter many types of errors
  - *User input* — enter invalid filenames or URLs
  - *Resource limitations* — disk full
  - *Code errors* — invalid array index, key not present in hash map, refer to a variable that is null, divide by zero, . .
- When we could anticipate what is going to happen we would rather signal the error than program crash
- Exception handling - gracefully recover from errors that occur when running code

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- All exceptions descend from class `Throwable`
  - Two branches, `Error` and `Exception`
- `Error` — relatively rare, “not the programmer’s fault”
  - Internal errors, resource limitations within Java runtime
  - No realistic corrective action possible, notify caller and terminate gracefully
- `Exception` — two sub branches
  - `RuntimeException`, checked exceptions
- `RuntimeException` — programming errors that should have been caught by code
  - Array index out of bounds, invalid hash key, . . .
- `Checked exceptions`
  - Typically user-defined, code assumptions violated
  - In a list of orders, quantities should be positive integers

# W07:L02: Catching and handling exceptions

## Revision Slides

- try-catch
  - Enclose code that may generate exception in a try block
  - Exception handler in catch block
  - Use try-catch to safely call functions that may generate errors
- If try encounters an exception, rest of the code in the block is skipped
- If exception matches the type in catch, handler code executes
- Otherwise, uncaught exception is passed back to the code that called this code
- Can catch more than one type of exception
  - Multiple catch blocks
- Catch (ExceptionType e) matches any subtype of ExceptionType
- Catch blocks are tried in sequence
  - Match exception type against each one in turn
- Order catch blocks by argument type, more specific to less specific

# W07:L02: Throwing exceptions

## Revision Slides

- Declare exceptions thrown in header
- Can throw multiple types of exceptions
- Can throw any subtype of declared exception type
  - Can throw `FileNotFoundException`, `EOFException`, both subclasses of `IOException`
- Method declares the exceptions it throws
- If you call such a method, you must handle it
- ... or pass it on; your method should advertise that it throws the same exception
- Customized exceptions - Define a new class extending `Exception`
- Cleaning up resources
  - When exception occurs, rest of the try block is skipped
  - May need to do some clean up (close files, deallocate resources, . . . )
  - Add a block labelled finally

# W07:L03: Packages

## Revision Slides

- Java has an organizational unit called package
- Can use import to use packages directly
- If we omit modifiers, the default visibility is public within the package
  - This applies to both methods and variables
- Can also restrict visibility with respect to inheritance hierarchy
  - protected means visible within subtree, so all subclasses
  - Normally, a subclass cannot expand visibility of a function
  - However, protected can be made public

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Assertion checks are supposed to flag fatal, unrecoverable errors
- This should not be caught – Abort and print diagnostic information (stack trace)
- If assertion fails, code throws `AssertionError`

```
public static double myfn(double x){  
    assert x >= 0;  
}
```

- Can provide additional information to be printed with diagnostic message

```
public static double myfn(double x){  
    assert x >= 0 : x;  
}
```

- If you need to flag the error and take corrective action, use exceptions instead
- Turned on only during development and testing
  - Not checked at run time after deployment

# W07:L04: Assertions (Cont.)

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Assertions are enabled or disabled at runtime – does not require recompilation
- Use the following flag to run with assertions enabled

```
java -enableassertions MyCode
```

- Can use `-ea` as abbreviation for `-enableassertions`
- Can selectively turn on assertions for a class

```
java -ea:MyClasdes MyCo
```

- ... or a package

```
java -ea:in.ac.iitm.onlinedegree MyCode
```

- Similarly, disable assertions globally or selectively

```
java -disableassertions MyCode
```

```
java -da:MyClass MyCode
```

- Can combine the two

```
java -ea in.ac.iitm.onlinedegree -da:MyClass MyCode
```

- Separate switch to enable assertions for system classes

```
java -enablesystemassertions MyCode
```

```
java -esa MyCode
```

# W07:L05: Logging

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Logging gives us more flexibility and control over tracking diagnostic messages than simple print statements
- Example: call `info()` method of global logger:  
`Logger.getGlobal().info("Edit->Copy menu item selected");`
- Can define a hierarchy of loggers
- Seven levels of messages — `SEVERE`, `WARNING`, `INFO`, `CONFIG`, `FINE`, `FINER`, `FINEST`
  - By default, first three levels are logged
- Can set a different level  
`logger.setLevel(Level.FINE);`
- Turn on all levels, or turn off all logging  
`logger.setLevel(Level.ALL);`  
`logger.setLevel(Level.OFF);`
- Control logging from within code or through external configuration file

# W08:L01: Cloning

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

**Week 8**

Week 9

Week 10

Week 11

Week 12

- Making a faithful copy of an object is a tricky problem
- Java provides a clone() function in Object that does shallow copy
- However, shallow copy aliases nested objects
- Deep copy solves the problem, but inheritance can create complications
- To force programmers to consciously think about these subtleties, Java puts in some checks to using clone()
- Must implement marker interface Cloneable to allow clone()
- clone() is protected by default. override as public if needed
- clone() in Object throws CloneNotSupportedException, which must be taken into account when overriding

# W08:L02: Type inference

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Automatic type inference can avoid redundancy in declarations

```
Employee e = new Employee(...)
```

- Java allows limited type inference
  - Only for local variables in functions
  - Not for instance variables of a class

```
var b = false; // boolean
```

```
var s = "Hello, world"; // String
```

- Challenge is to do this statically, at compile-time

- Use generic `var` to declare variables

```
var d = 2.0; // double
```

- Must be initialized when declared
- Type is inferred from initial value

```
var f = 3.141f; // float
```

- Be careful about format for numeric constants

```
var e = new Manager(...); // Manager
```

- For classes, infer most constrained type
  - `e` is inferred to be `Manager`
  - `Manager` extends `Employee`
  - If `e` should be `Employee`, declare explicitly

# W08:L03: Higher order functions

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Passing a function as an argument to another function
- In object-oriented programming, this is achieved using interfaces – encapsulate the function to be passed as an object
- Lambda expressions denote anonymous functions
  - (Parameters) -> Body
  - Return value and type are implicit
- Interfaces that define a single function are called **functional interfaces**
  - **Comparator**, **Timerowner**
- Substitute wherever a functional interface is specified

```
String[] strarr = new ...;  
Arrays.sort(strarr, (String s1, String s2) -> s1.length() - s2.length());
```
- Limited type inference is also possible
  - Java infers **s1** and **s2** are **String**

```
String[] strarr = new ...;  
Arrays.sort(strarr, (s1, s2) -> s1.length() - s2.length());
```
- More complicated function body can be defined as a block

# W08:L03: Higher order functions

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- If the lambda expression consists of a single function call, we can pass that function by name – **method reference**
- We saw an example with adding entries to a Map object – here sum is a static method in Integer

```
Map<String, Integer> scores = ...;  
scores.merge(bat, newscore, Integer::sum);
```

- Here is the corresponding expression, assuming type inference

```
(i,j) -> Integer::sum(i,j)
```

- **ClassName::StaticMethod** – method reference is **C::f**, and corresponding expression with as many arguments as **f** has

```
(x1,x2,...,xk) -> C::f(x1,x2,...,xk)
```

- **ClassName::InstanceMethod** – method reference is **C::f**, and called with respect to an object that becomes implicit parameter

```
(o,x1,x2,...,xk) -> o.f(x1,x2,...,xk)
```

- **object::InstanceMethod** – method reference is **o::f**, and arguments are passed to **o.f**

```
(x1,x2,...,xk) -> o.f(x1,x2,...,xk)
```

# W08:L04: Streams

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- We can view a collection as a stream of elements
- Process the stream rather than use an iterator
- Declarative way of computing over collections
- Create a stream, transform it, reduce it to a result
- Processing can be parallelized
  - `filter()` and `count()` in parallel
- Apply `stream()` to a collection
  - Part of Collections interface
- Use static method `Stream.of()` for arrays
- Create a stream, transform it, reduce it

```
long count = words.stream()
    .filter(w -> w.length() > 10)
    .count();
}
```

```
long count = words.parallelStream()
    .filter(w -> w.length() > 10)
    .count();
}
```

# W08:L04: Streams (Cont.)

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Static method `Stream.generate()` generates a stream from a function
- `Stream.iterate()` — a stream of dependent values
- `filter()` to select elements – takes a predicate as argument
- `map()` applies a function to each element in the stream
- `flatMap()` flattens (collapses) nested list into a single stream
- Make a stream finite — `limit(n)`
- Skip n elements — `skip(n)`
- Stop when element matches a criterion — `takeWhile()`
- Start after element matches a criterion — `dropWhile()`
- Number of elements — `count()`
- Largest and smallest values seen - `max()` and `min()`
- First element — `findFirst()`
- What happens if the stream is empty? Return value is optional type

# W09:L01: Optional Types

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- `Optional<T>` is a clean way to encapsulate a value that may be absent
- Different ways to process values of type `Optional<T>`
  - Replace the missing value by a default
  - Ignore missing values
- `max()` and `min()` – what happens if the stream is empty?
- `max()` of empty stream is undefined – return value could be `Double` or `null`
- `Optional<T>` object – wrapper
- May contain an object of type `T` if value `present`, or no object
- Use `orElse()` to pass a default value

```
Optional<Double> maxrand =  
    Stream.generate(Math::random)  
        .limit(100)  
        .filter(n -> n < 0.001)  
        .max(Double::compareTo);
```

```
Double fixrand = maxrand.orElse(-1.0);
```

# W09:L01: Optional Types (Cont.)

Week 10

Week 11

Week 12

- Use `orElseGet()` to call a function to generate replacement for a missing value

```
Double fixrand = maxrand.orElseGet(  
    () -> SomeFunctionToGenerateDouble  
);
```

- Use `orElseThrow()` to generate an exception when a missing value is encountered

```
Double fixrand =  
    maxrand.orElseThrow(  
        IllegalStateException::new  
    );
```

- Use `ifPresent()` to test if a value is present, and process it

```
optionalValue.ifPresent(  
    v -> Process v);
```

- Use `ifPresentOrElse` to Specify an alternative action if the value is not present

```
maxrand.ifPresentOrElse(  
    v -> results.add(v),  
    () -> System.out.println("No max")  
);
```

# W09:L01: Optional Types (Cont.)

## Revision Slides

- Creating an optional value
  - `Optional.of(v)` creates value `v`
  - `Optional.empty` creates empty optional
- Use `ofNullable()` to transform `null` automatically into an empty optional
- `map` applies function to value, if present; if input is `empty`, so is output

```
Optional<Double> maxrandsqr = maxrand.map(v -> v*v);
```
- Supply an alternative for a missing value using `or()`

```
Optional<Double> fixrand = maxrand.or(() -> Optional.of(-1.0));
```
- `flatMap` allows us to cascade functions with optional types
  - Use `flatMap` to regenerate a stream from optional values

# W09:L02: Collecting results from streams

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Convert collections into sequences of values — streams
- `Stream` defines a standard iterator, use to loop through values in a stream
- Alternatively, use `forEach` with a suitable function

```
mystream.forEach(System.out::println);
```
- Can convert a stream into an array using `toArray()`

```
Object[] result = mystream.toArray();
String[] result = mystream.toArray(String[]::new);
```
- What if we want to convert the stream back into a collection? – use `collect()`
- Pass appropriate **factory method** from `Collectors`
- Create a list from a stream

```
List<String> result = mystream.collect(Collectors.toList());
```
- . . . or a set

```
Set<String> result = mystream.collect(Collectors.toSet());
```
- To create a concrete collection, provide a constructor

```
TreeSet<String> result =
    stream.collect(Collectors.toCollection(TreeSet::new));
```

## W09:L02: Collecting results from streams (Cont.)

### Revision Slides

- `Collectors` has methods to aggregate summaries in a single object
  - `summarizingInt` works for a stream of integers

```
IntSummaryStatistics summary = mystream.collect(
    Collectors.summarizingInt(String::length));
double averageWordLength = summary.getAverage();
double maxWordLength = summary.getMax();
```

- Methods to access relevant statistics – `getCount()`, `getMax()`, `getMin()`, `getSum()`, `getAverage()`,
- Similarly, `summarizingLong()` and `summarizingDouble()` return `LongSummaryStatistics` and `DoubleSummaryStatistics`
- Convert a stream of `Person` to a map – For `Person p`, `p.getID()` is key and `p.getName()` is value

```
Stream<Person> people = ...;
Map<Integer, String> nameToID = people.collect(
    Collectors.toMap(Person::getId, Person::getName)
);
```

## W09:L02: Collecting results from streams (Cont.)

### Revision Slides

- Collect all ids with the same name in a list

```
Stream<Person> people = ...;  
Map<String, List<Person>> nameToPersons = people.collect(  
    Collectors.groupingBy(Person::getName)  
);
```

- Instead, may want to partition the stream using a predicate – Partition names into those that start with **A** and the rest

```
Stream<Person> people = ...;  
Map<Boolean, List<Person>> aAndOtherPersons =  
    people.collect(  
        Collectors.partitioningBy(  
            p -> p.getName().substr(0,1).equals("A")  
        )  
    );
```

# W09:L03: Input/output streams

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Input: read a sequence of bytes from some source – a file, an internet connection, memory
- Output: write a sequence of bytes to some source – a file, an internet connection, memory
- Read one or more bytes — abstract methods are implemented by subclasses of `InputStream`
- Close a stream when done — release resources
- Flush an output stream — output is **buffered**
- Similarly, write one or more bytes using – `OutputStream`
- Create an input stream attached to a file – `FileInputStream`
- Create an output stream attached to a file – `FileOutputStream`
- Overwrite or append? – Pass a boolean second argument to the constructor
- `Scanner` class – apply to any input stream – many read methods
- To write text, use `PrintWriter` class – apply to any output stream

## W09:L03: Input/output streams (Cont.)

### Revision Slides

- To read binary data, use `DataInputStream` class – many read methods
- To write binary data, use `DataOutputStream` class
- Buffering an input stream – reads blocks of data – `BufferedInputStream()`
- Similarly, write blocks using – `BufferedOutputStream()`
- `PushBackStream` can only `read()` and `unread()`
- Java has a whole zoo of streams for different tasks – random access files, zipped data, . . .

# W09:L04: Serialization

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- `DataInputStream` and `DataOutputStream` – read and write low level units like bytes, integers, floats, characters, . . .
- Can we export and import objects directly?
  - Backup objects onto disk, with state
  - Restore objects from disk
  - Send objects across a network
- **Serialization** and **deserialization**
- To write objects, Java has another output stream type, `ObjectOutputStream`
- Use `writeObject()` to write out an object
- To read back objects, use `ObjectInputStream`
- Retrieve objects in the same order they were written, using `readObject()`
- Class has to allow serialization — implement marker interface `Serializable`
- Some objects should not be serialized – mark such fields as `transient`
- Can override `writeObject()`
  - `defaultWriteObject()` writes out the object with all non-transient fields
  - Then explicitly write relevant details of transient fields

# W10:L01: Concurrent Programming

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Multiprocessing

- Single processor executes several computations “in parallel”
- Time-slicing to share access
- Private set of local variables
- Time-slicing involves saving the state of one process and loading the suspended state of another

- Threads

- Logically parallel actions within a single application
- Operated on same local variables
- Communicate via “shared memory”
- Context switches are easier

# W10:L01: Creating threads

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Have a class extend `Thread`
- Define a function `run( )` where execution can begin in parallel
- Invoke `start( )`, initiates `run( )` in a separate thread
- Directly calling `run( )` does not execute in separate thread!
- Cannot always extend `Thread`, Instead, implement `Runnable( )`
- To use class, `Runnable( )` explicitly create a `Thread` and `start( )` it

# W10:L02: Race conditions and mutual exclusion

- **Race condition:** Concurrent update of a shared variable can lead to data inconsistency
- **Critical sections:** sections of code where shared variables are updated
- **Mutual exclusion:** at most one thread at a time can be in a critical section

# W10:L03:Mutual Exclusion

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- At most one thread at a time can be in a critical section
- Using a two-(int)valued variable
  - Leads to starvation
- Using two boolean variables
  - Leads to deadlock
- Petersen Algorithm - Combination of a two-valued variable and two boolean variables
  - Avoids both starvation and deadlock
  - But difficult to generalize to more than two threads
- Bakery Algorithm - The thread itself acquires a token number by incrementing the current token number by 1.
  - If two threads get the same number, then some system parameter is used to break the tie.
  - To avoid this, the checking for max and incrementing should be made an atomic step.

# W10:L03:Mutual Exclusion

- Using a two-valued variable

Thread 1

```
...  
while (turn != 1){  
    // "Busy" wait  
}  
// Enter critical section  
...  
// Leave critical section  
turn = 2;  
...
```

Thread 2

```
...  
while (turn != 2){  
    // "Busy" wait  
}  
// Enter critical section  
...  
// Leave critical section  
turn = 1;  
...
```

# W10:L03:Mutual Exclusion

## Revision Slides

- Using two boolean variables

Thread 1

```
...
request_1 = true;
while (request_2){
    // "Busy" wait
}
// Enter critical section
...
// Leave critical section
request_1 = false;
...
```

Thread 2

```
...
request_2 = true;
while (request_1){
    // "Busy" wait
}
// Enter critical section
...
// Leave critical section
request_2 = false;
...
```

# W10:L03:Mutual Exclusion - Peterson Algorithm

## Revision Slides

- Using a single two-valued variable and two boolean variables

Thread 1

```
...
request_1 = true;
while (request_2){
    // "Busy" wait
}
// Enter critical section
...
// Leave critical section
request_1 = false;
...
```

Thread 2

```
...
request_2 = true;
while (request_1){
    // "Busy" wait
}
// Enter critical section
...
// Leave critical section
request_2 = false;
...
```

Week 7

Week 8

Week 9

**Week 10**

Week 11

Week 12

- Check the current value of a variable, then update it
- If more than one thread does this in parallel, updates may overlap and get lost
- Need to combine test and set into an atomic, indivisible step
- Cannot be guaranteed without adding this as a language primitive

# W10:L04:Semaphores

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Programming language primitive for **test-and-set** is given by **Semaphores**.

- | Thread 1                  | Thread 2                  |
|---------------------------|---------------------------|
| ...                       | ...                       |
| P(S);                     | P(S);                     |
| // Enter critical section | // Enter critical section |
| ...                       | ...                       |
| // Leave critical section | // Leave critical section |
| V(S);                     | V(S);                     |
| ...                       | ...                       |

- Semaphores guarantee
  - Mutual exclusion
  - Freedom from starvation
  - Freedom from deadlock

# W11:L1: Threads in JAVA

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Threads can be created by extending **Thread** class or implementing **Runnable** interface.
- We define a function **run** which is executed by the spawned threads of that class.
- Invoking the **start** method of the thread object initiates the **run** method on a separate thread (not the **main** thread).
- **Thread.sleep(arg)** suspends the thread for **arg** milliseconds.  
*A thread does not release its lock (if already gained) while in sleep.*
- **join()** method makes the thread executing this instruction wait for the thread on which **join** is called to complete its execution.
- Both **join** and **sleep** methods can throw **InterruptedException**.
- To check a thread's interrupt status one can use **t.isInterrupted()**. It does not clear the flag
- While writing a multithreaded program, one can either define multiple classes with their own **run** methods working on different features of the code or different threads can be filtered by their name inside one **run** method and corresponding utility functions are called using these threads.

# W11: Thread: Synchronization

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Shared variables between threads can show inconsistent values as a result of context switching of threads arbitrarily (race condition). In order to attain atomicity while updating shared variables the **synchronized** keyword is used.
- JAVA allows a method or a block of code to be executed in synchronized manner. In case of synchronization block, we mention the object whose lock would be held by the thread executing the synchronized block.
- Programs in which the critical section is synchronized will maintain consistent value of the shared variables irrespective of the degree of concurrency (number of threads).
- Intercommunication between threads can be done by using `wait()` and `notify()/notifyAll()` methods.
  - **wait()**: is used to suspend a thread. The thread loses its lock and goes to BLOCKED state.
  - **notify()**: signals one arbitrary thread waiting on that object that the object lock is now free to be gained.
  - **notifyAll()**: signals all waiting threads, but one of them will be picked by the system to be executed.
- **wait, notify, notifyAll** must always be used inside synchronized blocks/methods otherwise **IllegalMonitorStateException** is thrown.

# W11: Thread State

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- Life Cycle of a thread in JAVA:
  - **New:**  
Created but, `start()` is not invoked.
  - **Runnable:**  
`start()` method has been invoked and the thread is ready to be scheduled.
  - **Running:**  
the current thread is under execution.
  - **Blocked:**  
the thread is suspended by `wait()` method, it has lost its lock.
  - **Timed Waiting:**  
the thread is sleeping, holding its lock
  - **Terminated:**  
Either the thread has finished its job and has terminated normally or it has terminated because of some abnormal event like segmentation fault/unhandled exception.

# W11: Re-entrant Locks and Threadsafe Collections

## Revision Slides

Week 1

Week 2

Week 3

Week 4

Week 5

Week 6

Week 7

Week 8

Week 9

Week 10

Week 11

Week 12

- JAVA provides semaphore like mechanism to implement concurrency in programs using reentrant locks.  
ReentrantLock class
- A reentrant lock object has methods `lock()` and `unlock()` just like `P(s)` and `V(s)`.
- Always put the `unlock()` under a `finally` block.
- Why re entrant?
  - Thread already holding lock of an object can reacquire it.  
*very useful while working with recursive codes which must be executed atomically but in a multithreaded environment.*
- Threadsafe collections guarantees consistency of individual updates/accesses done by multiple threads on the same collection.
- Sequence of updates is still not guaranteed in threadsafe collections.
- JAVA provides built in collections which are threadsafe
  - `ConcurrentHashMap`
  - `BlockingQueue`
- A threadsafe collection will never throw `ConcurrentModificationException`
